2019 – 2022

UNDETECTED

DIGITAL PHOTOGRAPHY · DOCUMENTARY · SUBWAY ·
CONSTRUCTION SITE

I turned my attention from the abstract concept of "person" to the tangible "individual."

The ability of cameras to document social movements and instigate societal change propels me forward. Inspired by Lewis Hine's works on child labor, I am driven to use my camera to make even small but positive impacts in the world.

I am an explorer. The huge hole in the ground held an endless fascination for me. Boggy soil, swarming mosquitoes, rusting steel frames. I gazed at the nearly 100-foot sinkhole and slowly climbed down from the top of the scaffolding. Stepping over the protrusions in the steel, I moved my body cautiously.

I encountered the worker who was responsible for building here. I want to know – will they feel accomplishments for their brick-by-brick underground city growth? I don't want to impose pity or sympathy on them in my work. I would like to put myself in their shoes. I donned a reflective suit and helmet, disguised myself as one of them, and began my three-year documenting.

Hine's emphasis on the importance of "individuals" motivates me to continue highlighting the stories of those who are often overlooked.

RE: UNDETECTED

DIGITAL PHOTOGRAPHY · MULTITRACK SOUND · FLASHLIGHT ·
DARK ROOM

This interactive photography exhibition presents my previous photographic series, Undetected, within a fully enclosed and completely dark environment. The photographs are printed and installed throughout the space, while visitors are invited to use their own flashlights to navigate and view the works in total darkness. The act of looking becomes an exploration.

SOUND DESIGN

Recording Sites	Shenzhen Metro Construction Site
Sound Origins	Metal impact, subsurface low-frequency, machine breath, etc.
Post-Production	Pro Tools, Final Cut Pro

A PHOTOGRAPHY EXHIBITION THAT REFUSES TO
PROVIDE ITS OWN LIGHT, BUT RETURNING THE ACT
OF SEEING TO THE AUDIENCE.

To deepen this sense of immersion, I collected audio material from an active underground subway construction site, including the sharp clash of metal, the deep reverberation of the tunnel, and the mechanical rhythms of construction equipment. Using Pro Tools, I edited and mixed these recordings into a continuous looping sound composition. Multiple speakers are distributed throughout the space to create a surround-sound environment, with each speaker assigned a distinct sonic layer. For example, a wall-mounted speaker emits the low rumble of the tunnel, a small portable speaker plays metallic collision sounds, and a corner speaker carries the mechanical noise of operating equipment.

These elements reconstruct the sensory atmosphere of the underground construction site where the photographs were originally made, damp, muddy, and disorienting, allowing them to experience the physical and psychological conditions of subway exploration as myself.

ROBOMASTER

2020-2022 · FUSION 360 · PYTHON · ROBOTIC COMPETITION

This work was developed during the DJI RoboMaster Youth Robotics Competition, where I served as both the designer and programmer of our engineering robot. Within a system of multiple infantry robots and a single engineering unit, this machine occupied a unique position: it was not built for direct confrontation alone, but for movement, support, retrieval, and protection. It operated as a quiet mediator between strategy and action, navigating the space of the competition through precision and responsiveness.

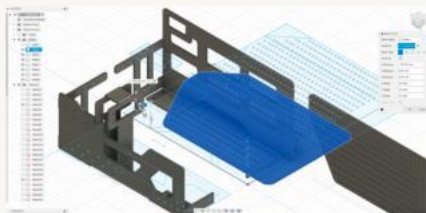

Arena

Perspective of "Right"

Our robot "Right"

I used Fusion 360 for industrial design modeling and optimized the robot's shell and gripping structure. This project allowed me to participate in the full development process, including mechanical design, structural modification, visual recognition, and automated control.

Modeling in Fusion 360

On the programming side, I was responsible for developing the engineering robot's autonomous operation system. According to the competition rules, during the first minute after the match begins, all robots must operate entirely autonomously without any human control. This required the robot to move automatically from the starting point to the ammunition collection area, perform precise grasping through visual recognition, avoid interference, follow planned paths, and execute basic defensive actions. To achieve this, I combined computer vision with Python-based motor control to realize automatic positioning, ammunition pickup, and corresponding defensive responses.

Solar Eclipse, 2020, Shanzhen, China

ASTROPHOTOGRAPHY

My astrophotography began with a Celestron Cassegrain telescope. From my earliest attempts at photographing the moon and the Milky Way to later exploring deep-sky subjects such as the Orion Nebula and the Pleiades, I gradually developed a connection with the universe through images. During the 2020 solar eclipse, I used Baader film, modified the telescope eyepiece myself, and, with the help of the laser cutter in my school's Fabrication Lab and design drawings made in Illustrator, created a filter device for safely observing the sun, allowing me to document the eclipse.

UNTITLED

Photography 2022

UNTITLED

DIGITAL PHOTOGRAPHY · 2022

Social media and instant message are permeating our normality, especially during the COVID era. In my view, communication as an important symbol of human civilization, human beings need to rely on not only the text itself to complete the entirely semantic understanding, but also the subtle body gestures and facial expressions from each other. The overflow of online communication is aggravating the neglect of the actual individuals around us. Inspired by social network headshots, I separate the individuals from real life and online to reveal the alienation between the characters through photography.

In the lighting design of this series of works, a large number of Baroque and Neoclassical paintings greatly inspired me. Reflected light was applied to make soft contrasting light like Tintoretto's and Rembrandt's painting. Caravaggio style cellar lighting and large continuous shadows were employed to create a breathtaking dramatic effect in my works.
